

Power Plant Project

There are 2 possible sites for the new power plant that meet all of the expectations of your company. The first one is next to Lake Koshkonong. The second is at Lake Geneva. The first site is a good choice because there are a couple cities near it that could use the power. However, the second site is clearly the better choice because there are multiple cities in all directions of the site. Lake Koshkonong is the biggest lake in the state with a volume about 57.5 million cubic meters. The requirement was 13 million cubic meters and Lake Geneva also surpasses that with a volume of about 40 million cubic meters. Both of these sites are located on farm land so there should not be a big issue population wise. The first site might be slightly less damaging to the environment solely because it is farther away from cities and other populations. I strongly urge you to choose Lake Geneva over Lake Koshkonong because it is overall a better, more affordable and efficient choice.
